

Learning Looks Different for Everyone

Learning Disabilities

A learning disability is when a person's brain processes information differently. It can affect how someone reads, writes, does math, or focuses, but it doesn't mean they are not smart!

People with learning disabilities often need different tools or strategies to learn and show what they know. With the right support, they can do just as well as anyone else.

Intellectual Disabilities

An intellectual disability affects how a person learns, solves problems, and handles everyday tasks. It usually means they may learn things more slowly or need more support in school and in life.

But having an intellectual disability doesn't mean a person can't live a full life - they just need extra help, and they bring value in their own way.

Having a Learning Disability
or
an Intellectual Disability
does not mean someone is not smart,
capable, or creative.

Acceptance means creating
a school culture where
all minds are valued.
